

SAM: Idiopathic Intracranial Hypertension (IIH)

The prevalence of idiopathic intracranial hypertension (IIH) is increasing parallel to the worldwide obesity epidemic. Patients with IIH often present initially to the optometrist with concerns about their visual symptoms, and they are at risk for vision loss without proper diagnosis and management.

This self-assessment module provides an opportunity to test your knowledge of this syndrome, including diagnosis, risk factors, associated conditions, treatment and management, and possible complications.

Documents for review prior to assessment:
